**ABSTRACT**

*Ixora coccinea* Linn (Rubiaceae), a small shrub cultivated throughout India, has been reported to possess a number of medicinal properties. It has traditionally been used for the treatment of diarrhea and dysentery. However, the claims of Ayurveda have to be validated by suitable experimental models. The present study was therefore undertaken to evaluate the effect of aqueous extract of *I. coccinea* for its antidiarrheal potential against several experimental models of diarrhea in albino Wistar rats. Here, we report the effects of aqueous extracts of flowers of *I. coccinea* in the castor oil induced diarrhea model. The gastrointestinal transit rate was expressed as the percentage of the longest distance traversed by charcoal divided by the total length of the small intestine. Weight and volume of intestinal content induced by castor oil were studied by the enteropooling method. Loperamide was used as a positive control. The plant-extract showed significant (*P*<0.001) inhibitor activity against castor oil induced diarrhea and castor oil induced enteropooling in rats at the dose of 400 mg/kg. There was also significant reduction in gastrointestinal motility in the charcoal meal test. Results obtained in this study substantiate the antidiarrheal effect of the aqueous extract and its use by traditional practitioners in the treatment of diarrhea.

**Key words:** Antidiarrheal activity, Castor oil induced diarrhea, enteropooling method, *Ixora coccinea* Linn, Small intestinal transit, Traditional medicine

**INTRODUCTION**

In developing countries, diarrhea continues to be one of the leading causes of mortality and morbidity in children less than 5 years old. According to World Health Report, diarrhea is the cause of 3.3% of all deaths. Worldwide distribution of diarrhea accounts for more than 5–8 million deaths each year in children. The incidence of diarrheal disease still remains high despite the effort by many government and international organizations to reduce it. Use of traditional medicines to combat the consequences of diarrhea has been emphasized by WHO in its Diarrhoea Control Programme. It is therefore important to identify and evaluate available natural drugs as alternatives to current antidiarrheal drugs, which are not always free from adverse effects. Several studies have shown the beneficial effects of a number of medicinal plants used traditionally in the treatment of diarrheal disease, one such being *Ixora coccinea*. I. *coccinea* Linn. is a small shrub cultivated throughout India. (Flame of Woods in English, Rangan in Hindi and Bengali, Kisukare in Kannada.) Roots and flowers are used in dysentery, dysmenorrhea, leucorrhoea, hemoptysis, and catarrhal bronchitis. Leaves are used in diarrhea. Roots are also used in hiccup, nausea, loss of appetite and externally for the treatment of sores, eczema, chronic ulcers. Roots contain aromatic acid oil, tannin, fatty acids. Leaves yield flavonols, kaemferol, quercetin, proanthrocyanidines, phenolic acids, and ferulic acids. Flowers yield cyanidins, flaconboides, and cooling material related to quercitin. Roots ground into pulp, mixed with water and as tincter are used for diarrhea and dysentery. However, scientific evidence to verify these claims is limited.

The present study was undertaken to evaluate the antidiarrheal activity of extracts of *I. coccinea* Linn flowers against experimentally induced diarrhea.
MATERIAL AND METHODS

Plant material
The flowers used in the study were collected in Karnataka’s Belgaum district in the month of November–December, 2007 and authenticated by Prof: A. P. Kore, Department of Botany, R.L.S. College Belgaum. The voucher specimen (number 00545) was deposited in the departmental herbarium for further references. The flowers were shade dried for a period of 4 weeks after which they were finely powdered. Cold flower extracts were prepared according to the method described by Rawlins.[23] The powder was dissolved in water in the ratio of 1:3 (250 mg of powder in 750 ml of distilled water), and shaken three to four times a day for a period of 7 days.[25] After filtration, the filtrate was concentrated and dried under reduced pressure. The extract was brown in color, semifluid form, with a yield of 18.6% (w/w). The extract was stored in desiccators until use.

Phytochemical screening
The freshly prepared extract was subjected to standard phytochemical screening tests for various constituents.[24] Alkaloids, glycosoids, tannins, saponins, sterols, and flavanoids.

Animals used
Albino Wistar rats weighing 150–200 g of both sexes were used. They were housed in standard polypropylene cages, at room temperature (24 ± 2°C) and exposed to a 12:12 h light and dark cycle. The rats were fed on a standard diet (Gold Mogr Lipton India Ltd.) and water ad libitum. The study protocol was approved by the institutional animal ethical committee (Ethical committee IAEC-reg.no.627/02/a CPCSEA) of Jawaharlal Nehru Medical College, Belgaum.

Castor oil induced diarrhea
The study employed the method described by Niemegeers et al.[28] The rats were fasted for 24 h before the test with free access to water, and divided into five groups of six animals each. Diarrhea was induced by administering 1 ml of castor oil orally. Group I treated as control (2 ml/kg, ip saline), group II received loperamide (5 mg/kg) served as standard, and group III–V received extract (100, 200, and 400 mg/kg ip) 1 h before castor oil administration. Consistency of fecal matter, numbers of both wet and dry diarrheal droppings were counted every hour for a period of 4 h.

Statistical analysis
Experimental results are represented as mean ± SE (standard error of mean). Student’s *t*-test was used for the evaluation of data.

RESULTS

Phytochemical screening
Results of preliminary phytochemical screening of the aqueous extracts revealed the presence of alkaloids, flavonoids, tannins, glycosoids, and absence of saponins and sterols.

Castor oil induced diarrhea
Diarrhea was apparent in all the animals of control group 30 min after administration of castor oil, for the next 4 h. This was largely eliminated by intraperitoneal injection of loperamide, 5 mg/kg (48.12%) [Table 1]. The effect of the extract was not as potent as loperamide in the dose of 100 mg/kg, but in the doses 200 and 400 mg/kg, the extract produced a significant dose-dependent reduction in the number of defecations over 4 hours (*P* < 0.001).

Castor oil induced enteropooling
Castor oil caused accumulation of water and electrolytes in the intestinal loop. Treatment with extract (100, 200, and 400 mg/kg) produced a significant, dose-dependent reduction...

in intestinal weight and volume [Table 2]. Significant results (*P < 0.001*) were observed at doses of 200 and 400 mg/ kg

### Small intestinal transit

The aqueous extract of *I. coccinea* significantly decreased the propulsion of the charcoal meal through the gastrointestinal tract compared to the control group. Loperamide (5 mg/kg) produced a marked decrease in the propulsive movement and intestinal length traveled by the charcoal [Table 3].

### DISCUSSION AND CONCLUSION

Results of this study suggest that aqueous extracts of flowers of *I. coccinea* in graded doses of 100, 200, and 400 mg/kg body weight reduced diarrhea by inhibiting intestinal motility, intestinal fluid accumulation, significantly reducing the frequency of defecation. This justifies folk medicine’s use of aqueous extract of *I. coccinea* Linn.

Castor oil is known to produce changes in intestinal mucosal permeability to electrolyte and water leading to diarrhea.[29,30] Antidiarrheal activity of these extracts may be attributable to one of the following mechanisms:

(a) The extract may increase the reabsorption of NaCl and water by decreasing the intestinal motility by charcoal meal.

(b) The presence of tannates in the extract may make the intestinal mucosa more resistant and reduce the secretion.[31,32] Tannic acid and tannins are water-soluble polyphenols that are present in many plants.[33]

(c) Liberation of recinoleic acid by castor oil results in irritation and inflammation of intestinal mucosa leading to release of prostaglandins.[34,35] The extract may reduce prostaglandin secretion.

(d) Flavonoids and alkaloids are known to inhibit release of autocoids and prostaglandin, thereby inhibiting secretion induced by castor oil.[36,37] Phytochemical analysis of aqueous extract of *I. coccinea* showed the presence of flavonoids, alkaloids, and tannins. Antidiarrheal and antidysenteric properties of

medicinal plants were found to be due to tannins, alkaloids, saponins, flavonoids, sterols, and reducing sugars.\(^{[18]}\) Sesquiterpenes, diterpenes, terpenes, flavonoids, and terpenoid derivatives are known for inhibiting release of autocoids and prostaglandins, thereby inhibiting the motility and secretion induced by castor oil.\(^{[39,40]}\) Loperamide, a synthetic opiate analogue, regulates the gastrointestinal tract by inhibiting its propulsive motor activity, predominantly in the jejunum and this effect is partially inhibited by opiate antagonists. Loperamide is also reported to reduce colonic rate of flow and consequently increase colonic water absorption, but it does not have any effect on colonic motility.\(^{[41]}\)

The study has intentionally been undertaken using a crude aqueous extract as it is our belief that the different biological activities assessed herein may not be due to a single constituent. This has also been highlighted by Mayer Manga et al.,\(^{[42]}\) who have stated that the crude extracts contain several compounds acting on different mechanisms. In addition interplay of constituents in the crude extract may result in better activity due to synergism or lead to decrease in toxicity; it is possible that pure compounds do not behave in the same manner as natural extracts.\(^{[43,44]}\)

To conclude, the present study supports claims by traditional medical practitioners about the use of aqueous extracts of *I. coccinea* Linn. in the treatment of diarrhea. The study included multiple bioassays covering the entire spectrum of activities that can provide more reliable evaluation of the plant's biological efficacy. The active constituent(s) responsible for antidiarrheal activity remain to be identified; further studies are required to understand the mechanism of action of its antidiarrheal activity.
